

1) (5 pts) DSN (Recursive Coding)

Consider the problem of a frog jumping out of a well. Initially, the frog is n feet below the top of the well. When the frog jumps up, it elevates u feet. If a jump gets the frog to the top of the well or past it, the frog escapes the well. If not, unfortunately, the frog slips down by d feet before clinging to the side of the well. (Note that $d < u$.) Write a recursive function that takes in positive integers, n , u , and d , and returns the number of times the frog must jump to get out of the well.

For example, if $n = 10$, $u = 5$ and $d = 3$, the function should return 4. On the first jump, the frog goes from 10 feet below the top to 8 feet below (5-3 is the progress). On the second jump, the frog goes from 8 feet below the top to 6 feet below the top. On the third jump, the frog goes from 6 feet below the top to 4 feet below the top. On the last jump, since 5 feet is enough to clear the top of the well, the frog does not slip down and gets out. In this case, had $n = 11$, the frog would have also gotten out in 4 jumps.

(Note: Although one can do some math to arrive at an $O(1)$ solution without recursion, please use recursion to simulate the jumping process described as this is what is being tested - the ability to take a process and express it in code, recursively. Also, though this is a toy problem, it's surprisingly similar to the real life process of paying off a loan, though in the latter process, the amount you "slip down" slowly decreases, month after month.)

```
int numJumps(int n, int u, int d) {  
  
    if (u >= n) return 1;           // 2 pts  
    return 1 + numJumps(n-(u-d), u, d); // 3 pts  
}
```

**Grading: 1 pt for checking base case, 1 pt for the return in this case.
1 pt for adding one jump, 2 pts for the recursive call**
