

1) (10 pts) DSN (Dynamic Memory Management in C)

The struct, `dataTOD`, shown below, is used to collect data from different devices connected to the CPU. Every time the data is updated a new buffer containing the structure's data is created and populated.

```
typedef struct dataTOD {  
    int seconds;        // seconds since midnight  
    double data;        // data sample  
    char * dataName;    // data name (optional)  
} dataTOD;
```

- (a) (8 pts) Write the code necessary to create and initialize the members of `dataTOD` in a function named `init_dataTOD` that returns a pointer to the newly created buffer. Return `NULL` in the event a buffer cannot be created. Otherwise, set the `seconds` and `data` values according to the corresponding input parameters to `init_dataTOD`, dynamically allocate the proper space for `dataName` and then copy the contents of `name` into it (not a pointer copy) and return a pointer to the newly created struct.

```
dataTOD * init_dataTOD(int sec, double val, char* name){
```

```
}
```

- (b) (2 pts) Complete the function below so that it frees all the dynamically allocated memory pointed to by its formal parameter `zapThis`. You may assume that the pointer itself is pointing to a valid struct and its `dataName` pointer is pointing to a dynamically allocated character array.

```
void free_dataTOD(dataTOD *zapThis){
```

```
}
```
