

1) (10 pts) DSN (Binary Search Trees)

A modified BST node stores the sum of the data values in its sub-tree. **Complete** writing the insert function shown below recursively, so that it takes in a pointer to the root of a binary search tree, *root*, and an integer, *value*, inserts a node storing value in it into the tree and returns a pointer to the root of the resulting tree. Notice that this task is more difficult than a usual binary tree insert since the sum values in several nodes must be updated as well. The struct used to store a node is shown below.

```
typedef struct bstNode {
    struct bstNode * left, * right;
    int data;
    int sum;
} bstNode;
```

```
bstNode* insert(bstNode * root, int value){

    if (root == NULL) {
        bstNode* res = malloc(sizeof(bstNode));

        res->data = _____;

        res->sum = _____;

        res->left = _____;

        res->right = _____;
        return res;
    }

    if (value <= root->data)

        _____ ;

    else

        _____ ;

    _____ ;

    return root;
}
```
