

## 1) (5 pts) DSN (Dynamic Memory Management in C)

Suppose we have a function that is designed to take in a large string and trim it down to only the needed size. The function is called trim\_buffer. It takes in 1 parameter: the buffer, which is a string with a max size of 1024 characters. It returns a string that is only the size needed to represent the valid characters in the buffer. The function is implemented below.

Identify all of the errors (there are multiple errors) with the following trim\_buffer function.

```
#define BUFFERSIZE 1024

// Pre-condition: buffer has a '\0' character at or before index
//                BUFFERSIZE-1.
// Post-condition: returns a pointer to a dynamically allocated
//                string that is a copy of the contents of buffer,
//                dynamically resized to the appropriate size.
char * trim_buffer(char * buffer) {
    char *string;
    int length;

    while (length < BUFFERSIZE && buffer[length] != '\0')
        length++;

    string = malloc(sizeof(char) * (length));

    length = 0;
    while ((string[length] = buffer[length]) != '\0')
        length++;

    return;
}
```

**Errors to find:**

Allocating length characters instead of length + 1 characters – **Grading: 3 points**

Length should be initialized before the first while loop – **Grading: 1 point**

Return value should be string instead of empty – **Grading: 1 point**
