

## 2) (10 pts) ANL (Algorithm Analysis)

(a) (5 pts) A matrix factorization algorithm that is run on a input matrix of size  $n \times n$ , runs in  $O(n^3)$  time. If the algorithm takes 54 seconds to run for an input of size  $3000 \times 3000$ , how long will it take to run on an input of size  $1000 \times 1000$ ?

Let  $T(n)$  be the run-time of the algorithm on a matrix input of size  $n \times n$ . We have:

$$T(3000) = c3000^3 = 54 \text{ sec}$$

$$c = \frac{54}{27 \times 10^9} \text{ sec} = \frac{2}{10^9} \text{ sec}$$

We desire to find  $T(1000)$ :

$$T(1000) = c(1000^3) = \frac{2 \text{ sec}}{10^9} \times 10^9 = 2 \text{ sec}$$

**Grading: 2 pts solving for c, 2 pts plugging in c, 1 pt for simplifying to 2 sec. Ratio method is valid as well, map points accordingly.**

(b) (5 pts) A string algorithm with inputs of lengths  $n$  and  $m$  runs in  $O(n^2m)$  time. If the algorithm takes 2 seconds to run on an input with  $n = 1000$  and  $m = 500$ , how long will the algorithm take to execute on an input with  $n = 250$  and  $m = 1000$ ?

Let  $T(n, m)$  be the run-time of the algorithm on strings inputs with lengths  $n$  and  $m$ . We have:

$$T(1000, 500) = c(1000^2)(500) = 2 \text{ sec}$$

$$c = \frac{2 \text{ sec}}{5 \times 10^8}$$

We desire to find  $T(250, 1000)$ :

$$T(250, 1000) = c(250^2)(1000) = \frac{2 \text{ sec}}{5 \times 10^8} \times 625 \times 10^5 = \frac{250}{1000} \text{ sec} = .25 \text{ sec}$$

**Grading: 2 pts solving for c, 3 pts obtaining final answer. Ratio method is valid as well, map points accordingly.**
