1) (5 pts) ANL (Algorithm Analysis)

What is the best and worst case runtime for the following algorithm, in terms of the input parameter n? You may assume that the array pointed to by arr is of length n. Give a brief explanation for your answers.

```
int foo(int * arr, int n, int value){
  int cur = 0, jump = n/2;
  while (jump > 0) {
    if (value > arr[cur])
        cur += jump;
    else if (value == arr[cur])
        return cur;
    jump = jump/2;
}

return cur;
}
```
