1) (10 pts) DSN (Dynamic Memory Management in C)

The struct, dataTOD, shown below, is used to collect data from different devices connected to the CPU. Every time the data is updated a new buffer containing the structure's data is created and populated.

(a) (8 pts) Write the code necessary to create and initialize the members of dataTOD in a function named init_dataTOD that returns a pointer to the newly created buffer. Return a NULL in the event a buffer cannot be created. Otherwise, set the seconds and data values according to the corresponding input parameters to init_dataTOD, dynamically allocate the proper space for dataName and then copy the contents of name into it (not a pointer copy) and a return a pointer to the newly created struct.

```
dataTOD * init_dataTOD(int sec, double val, char* name) {
    dataTOD * tDta = malloc(sizeof(dataTOD));
    if (tDta == NULL)
        return NULL;
    tDta->seconds = sec;
    tDta->data = val;
    tDta->dataName = malloc((strlen(name)+1)*sizeof(char));
    strcpy(tDta->dataName, name);
    return tDta;
}
```

Grading: 1 point for each line shown above. Assign partial if necessary but assign a whole number of points.

(b) (2 pts) Complete the function below so that it frees all the dynamically allocated memory pointed to by its formal parameter zapThis. You may assume that the pointer itself is pointing to a valid struct and its dataName pointer is pointing to a dynamically allocated character array.

```
void free_dataTOD(dataTOD *zapThis) {
    free(zapThis->dataName);
    free(zapThis);
}
```

Grading: 1 pt each line
